

# Human Testing Protocol for CTRL-Q

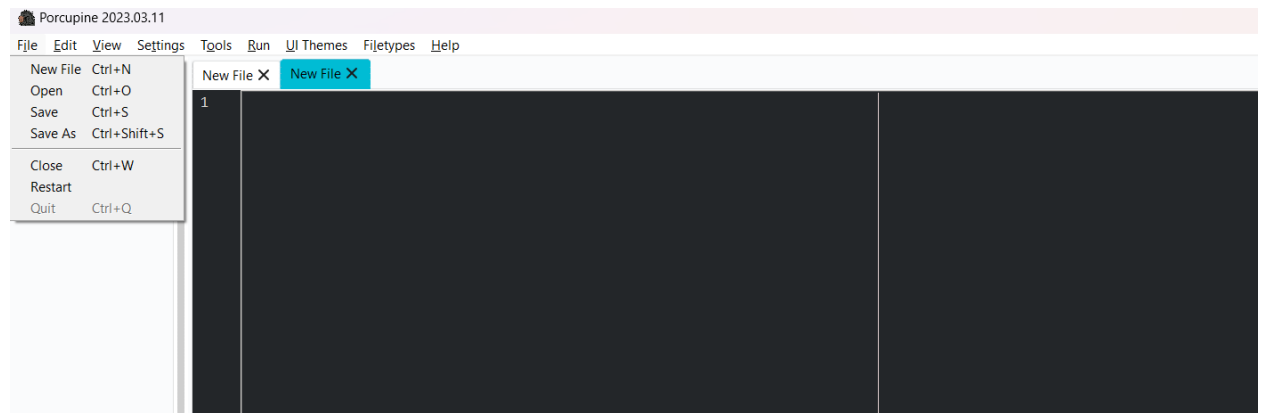

1. Launch Porcupine at command line using

```
python -m porcupine
```

2. Observe the state of the 'Quit' option in the 'File' menu. By default, the 'ctrl-q' quit feature should be enabled.

3. Open multiple tabs and ensure that the 'Quit' option is enabled or disabled (disabled when tabs are open).

4. Go to the settings menu and find the checkbox labeled "ctrl-q quit when no tabs are open". Toggle this checkbox to enable or disable the 'ctrl-q' quit feature and verify that the behavior of the 'Quit' option in the 'File' menu changes accordingly.
